**MONITORING AND MODELLING OF WATER QUALITY  
CHARACTERISTICS ALONG A RETICULATION SYSTEM: A CASE  
STUDY OF MODIMOLLE RETICULATION NETWORK**

**by**

**MEHLO MAHLOMOLA BTech (Eng)**

Dissertation submitted in fulfillment of the requirements for the Degree of **Magister Technologiae** in the Department of Civil Engineering and Building, Faculty of Engineering and Technology, Vaal University of Technology.

**Supervisor:** Prof. J.M. Ndambuki, BSc (Hons) Eng, MSc, PhD

**Co-supervisor:** Dr. R. Salim Wanjala, BSc (Hons) Eng, MSc, PhD

January 2012

## **Declaration**

I declare that this dissertation is my own unaided work, except where specific acknowledgement is made in the form of a reference. The dissertation is being submitted for the degree of Magister Technologiae: Civil Engineering at the Vaal University of Technology, Vanderbijlpark. It has not been submitted before for any examination.

## Acknowledgements

First and foremost, I would like to thank God for enabling me to go through this course. This work was made possible through the assistance of various people. Special thanks to the following institution and people: Magalies Water (MW) Management for supporting this study with their infrastructure; Magalies Water scientific services personnel (Ms Morake, Mr Moganetsi and Mr Mafanywa) for their assistance in testing of samples and guidance with scientific matters. Magalies Water Geographic Information System (GIS) Manager, Mr Montoedi, for his support through the use of Infrastructure Management Query System (IMQS). Modimolle Local Municipality for allowing the study to be conducted within their area of water supply. Finally and most importantly, my supervisors, Professor Ndambuki and Doctor Salim, for their guidance, unwavering support and patience throughout this study.

## **Dedication**

This work is dedicated to my former colleague and friend, Tsietsi Moganetsi, who passed away during September 2011. Mr Moganetsi was a Laboratory Technician at Magalies Water and he assisted me greatly with the testing of the samples for this study. May his soul rest in peace.

## Abstract

Potable water quality can deteriorate immensely from point of treatment to point of usage. This change in quality along a bulk distribution main may be attributed to numerous factors, such as the ingress of storm water. Furthermore, water utilities experience challenges in terms of the microbiological organisms that are not attributed to operational practices. For example, drinking water bulk distribution mains may be a shelter for these microorganisms that are sustained by organic and inorganic nutrients present within the pipe itself. These microorganisms may be active in the water being transported by the pipe, and can cause a significant drop in the water quality. In order to deal with the problem of deteriorating water quality, sufficient information within the bulk main is required, so that the consumer can be protected from ingesting contaminated water or water of poor quality. Hence, the overall objective of this study was to investigate and model water quality characteristics within the Modimolle reticulation network.

Water samples were collected from various points throughout the entire system for quality analysis. Different sampling points were established along the main pipeline as well as within the Modimolle distribution system. Water quality software, EPANET, was then used to model the water quality deterioration for both the bulk line and the reticulation network of Modimolle extension 11. Residual chlorine was the main parameter which was monitored. This study presents results of a research on water quality variation within a long distribution mains conveying water up to 87 km. Results show that raw residual chlorine is constantly depleted along the pipeline, and is therefore unable to be maintained at the required level of 0.2 mg/l, as stipulated by the Department of Water Affairs. This means that if any harmful contaminants should enter the water, the residual chlorine in the water will not be able to protect the consumers from the contaminants.

## TABLE OF CONTENTS

Declaration.....	ii
Certification.....	ii
Acknowledgements.....	iii
Dedication.....	iv
Abstract.....	v
List of figures.....	ix
List of tables.....	x
Nomenclature, Terms and Concepts.....	xi

### **CHAPTER 1: INTRODUCTION.....1**

1.1 General Background.....	1
1.2 Statement of the Problem.....	3
1.3 Justification of the Study.....	3
1.4 Delineation.....	4
1.5 Research Objectives.....	4
1.5.1 Main Objective.....	4
1.5.2 Specific Objectives .....	4
1.6 Outline of the Dissertation.....	4

### **CHAPTER 2: LITERATURE REVIEW..... 5**

2.1 Critical Water Quality Parameters.....	5
2.2 Contaminants Origin in Potable Water.....	6
2.3 Processes that may Attenuate Contaminants in the Source Water.....	8
2.4 The Consequences of Rainfall or Irrigation.....	8
2.5 Raw Water.....	9
2.6 Klipdrift Water Treatment Plant.....	9
2.7 Pipeline from Klipdrift Water Treatment Plant to Modimolle.....	11
2.8 Waterborne Diseases Due to Contamination in the Distribution System.....	12

2.9 Microbiology of Distribution Networks for Drinking-Water Supplies.....	14
2.10 Water Quality Deterioration in Reservoirs.....	15
2.11 Water Quality Deterioration in Distribution or Storage Due to Biofilm Formation.....	17
2.12 Drinking Water Quality Framework for South Africa.....	18
2.13 The Effects of Supplied Potable Water Quality on Human Health in Urban Development.....	19
2.14 Water Quality Deterioration Due to Surge Events.....	19
 <b>CHAPTER 3: RESEARCH METHODOLOGY.....</b>	<b>21</b>
3.1 Equipment and Instrumentation.....	26
3.1.1 Equipment and Apparatus used and their Respective Functions.....	26
3.1.2 Calibration of Equipment.....	27
3.2 Sampling.....	28
3.2.1 Sampling at the Klipdrift Water Treatment Plant.....	28
3.2.2 Sampling Along the Main Pipeline to Modimolle .....	29
3.2.3 Sampling Within the Community of Modimolle.....	30
3.3 Data Testing.....	32
3.3.1 Initial Testing.....	33
3.3.2 Safety in Data Testing.....	33
3.4 Modelling Using EPANET .....	33
3.5 Sample Preservation.....	34
 <b>CHAPTER 4: PRESENTATION AND DISCUSSION OF RESULTS.....</b>	<b>36</b>
4.1 Introduction.....	36
4.2 Raw Water Quality Results.....	36
4.3 Potable Water Quality Tests Results.....	49
4.4 Modelling Results From EPANET Software.....	56
4.4.1 Network Modelling and Design.....	57
4.4.2 Modelled Network Results.....	58
4.4.3 Bulk Distribution Modelling Results.....	61

<b>CHAPTER 5: CONCLUSIONS AND RECOMMENDATIONS.....</b>	<b>64</b>
5.1 Conclusions.....	64
5.2 Recommendation.....	66
6 References.....	68
Appendices

## NOMENCLATURE, TERMS AND CONCEPTS

### Nomenclature

**CaCO<sub>3</sub>** – Calcium Carbonate

**BOD** - Biological Oxygen Demand

**DAFF** - Dissolved air flotation filtration

**DWEA** – Department of Water and Environmental Affairs

**EPANET** – Software used to model water networks

**GIS** - Geographic Information System

**IMQS** - Infrastructure Query Management System

**km** - kilometres

**mg/l** - milligrams per liter

**Ml/d** – Mega liters per day

**MPN** - Most probable number

**SANS** – South African National Standards

**TDS** - Total Dissolved Solids

**WHO** – World Health Organization

**WSA** – Water Service Authority

**WTP** - Water Treatment Plant

### Terms and Concepts

**Escherichia coli (E-coli)** – Used as indicators to test for the presence of microorganisms for pathogens that may be present in feces.

**Fecal Coli forms** – Used as an indicator of fecal contamination

**Hard Water** - Hard water is water that has high mineral content, particularly calcium and magnesium ions.

**Soft Water** – Soft water would therefore be water that has less or no mineral content, particularly calcium and magnesium ions.

**Scum** - Foam like substance which is formed when water saturated with air lifts the solids above the top surface of the saturated water.
